# 五分析函数

# 学习目标

• 掌握 LEAD, LAG, FIRST\_VALUE, LAST\_VALUE, NTH\_VALUE 函数的使用方法

# 0数据介绍

- 点击广告业务,通过用户点击广告收费,两张表格,一张访问信息统计表(STATISTICS),一张网站表(WEBSITE)
- 网站表 (WEBSITE):
  - id, name (网站名字), budget (每月预算)
  - o opened 开始运营的日期

| id | name             | budget | opened     |
|----|------------------|--------|------------|
| 1  | Gaming Heaven    | 3000   | 2016-02-01 |
| 2  | All About Health | 700    | 2016-03-15 |
| 3  | Around The World | 500    | 2016-05-01 |

- 访问信息统计表 (STATISTICS):
  - 。 此表记录了2016年5月的统计信息。每行数据均对应唯一的 website\_id 和特定的日期 day
  - user : 显示当天该网站的UV (unique visit, 独立IP, 一个UV代表 一个用户)
  - impressions: 广告展示的次数clicks: 是指广告的点击次数revenue: 每日点击产生的收入

| website_id | day        | users | impressions | clicks | revenue |
|------------|------------|-------|-------------|--------|---------|
| 1          | 2016-05-01 | 36169 | 108507      | 237    | 66.34   |
| 1          | 2016-05-02 | 29580 | 295800      | 793    | 214.12  |
| 1          | 2016-05-03 | 30907 | 463605      | 1545   | 401.79  |

# 1 LEAD(X)函数

• 与之前介绍的聚类函数和排序函数语法类似

```
<analytic function> OVER (...)
```

• 与聚类函数不同的地方是, 分析函数只引用窗口中的单个行

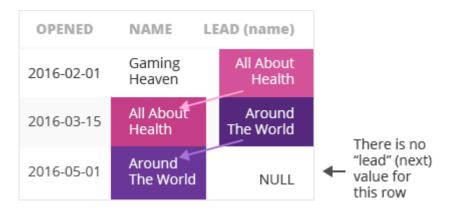

## LEAD(X)函数介绍

• 我们看下面的例子

```
SELECT

name,
opened,
LEAD(name) OVER(ORDER BY opened)
FROM website;
```

• 上面的SQL中,分析函数为LEAD (name) 。 LEAD中传入name列作为参数,将以 ORDER BY 排序后的顺序,返回当前行的下一行 name 列所对应的值,并在新列中显示,具体如下图所示:

- 注意: 最后一列没有下一列结果所以这里显示NULL
- LEAD() 中传入的列名与排序的列可以不同

#### 练习42

- 需求: 统计id 为1的网站,每天访问的人数以及下一天访问的人数
  - 。 返回字段: day 日期, users 访问人数, lead 下一天访问人数

```
SELECT
  day,
  users,
  LEAD(users) OVER(ORDER BY day) AS `lead`
FROM statistics
WHERE website_id = 1;
```

| day       | users | lead  |
|-----------|-------|-------|
| 2016/5/1  | 36169 | 29580 |
| 2016/5/2  | 29580 | 30907 |
| 2016/5/3  | 30907 | 19154 |
| 2016/5/4  | 19154 | 10897 |
| 2016/5/5  | 10897 | 24602 |
| 2016/5/6  | 24602 | 19882 |
| 2016/5/7  | 19882 | 26932 |
| 2016/5/8  | 26932 | 39275 |
| 2016/5/9  | 39275 | 28900 |
| 2016/5/10 | 28900 | 23714 |
| 2016/5/11 | 23714 | 19006 |
| 2016/5/12 | 19006 | 24791 |
| 2016/5/13 | 24791 | 27617 |
| 2016/5/14 | 27617 | 8563  |
| 2016/5/15 | 8563  | 33679 |
| 2016/5/16 | 33679 | 25123 |
| 2016/5/17 | 25123 | 32233 |
| 2016/5/18 | 32233 | 33504 |
| 2016/5/19 | 33504 | 10830 |
| 2016/5/20 | 10830 | 13904 |
| 2016/5/21 | 13904 | 35180 |
| 2016/5/22 | 35180 | 18911 |
| 2016/5/23 | 18911 | 19938 |
| 2016/5/24 | 19938 | 14796 |

| day       | users | lead  |
|-----------|-------|-------|
| 2016/5/25 | 14796 | 20953 |
| 2016/5/26 | 20953 | 14756 |
| 2016/5/27 | 14756 | 20397 |
| 2016/5/28 | 20397 | 30382 |
| 2016/5/29 | 30382 | 39977 |
| 2016/5/30 | 39977 | 34817 |
| 2016/5/31 | 34817 | NULL  |

## 使用LEAD()函数计算增量

• lead函数在计算增量的时候非常有用,比如我们想比较同一列两个值的 差值

```
SELECT
  day,
  clicks,
  LEAD(clicks) OVER(ORDER BY day),
  clicks - LEAD(clicks) OVER(ORDER BY day)
FROM statistics
WHERE website_id = 2;
```

- 上面的查询计算了每日增量:最后一列显示了当日与次日之间的点击次数差异
  - 。 从业务角度来看,这可以很容易地告诉我们有关该网站的很多信息
    - 如果大多数增量是正的,且增量在逐渐变大,那么该网站业务 可能处于上升期
    - 如果大多数是负的,那么需要找到收入下滑的原因

#### 练习43

• 需求: 统计id为1的网站,每日收入,后一天收入,以及每日收入的环比

```
SELECT
  day,
  revenue,
  LEAD(revenue) OVER(ORDER BY day) as `lead`,
  LEAD(revenue) OVER(ORDER BY day) - revenue as diff
FROM statistics
WHERE website_id = 1;
```

| day       | revenue | lead   | diff    |
|-----------|---------|--------|---------|
| 2016/5/1  | 66.34   | 214.12 | 147.78  |
| 2016/5/2  | 214.12  | 401.79 | 187.67  |
| 2016/5/3  | 401.79  | 38.31  | -363.48 |
| 2016/5/4  | 38.31   | 99.58  | 61.27   |
| 2016/5/5  | 99.58   | 184.92 | 85.34   |

#### LEAD(x,y)

- LEAD函数还可以传入两个参数:
  - 参数1 跟传入一个参数时的情况一样: 一列的列名
  - 参数2代表了偏移量,如果传入2就说明要以当前行为基准,向前移 动两列作为返回值
- 举例:

#### SELECT

name,

opened,

LEAD(opened, 2) OVER(ORDER BY opened)

FROM website;

• 上面的SQL中,LEAD函数传入了2,当前行为第一行时,会返回第三行的值作为LEAD函数的结果

## 练习 44

- 需求: 统计id为2的网站,在2016年5月1日到5月14日之间,每天的用户 访问数量以及7天后的用户访问数量
- 需要注意,最后7行最后一列会返回NULL,因为最后7行没有7日后的数据

```
SELECT

day,
users,
LEAD(users, 7) OVER(ORDER BY day) AS `lead`

FROM statistics

WHERE website_id = 2

AND day BETWEEN '2016-05-01' AND '2016-05-14'
```

| day        | users | lead |
|------------|-------|------|
| 2016-05-01 | 7058  | 5491 |
| 2016-05-02 | 7716  | 3350 |
| 2016-05-03 | 6877  | 9669 |
| 2016-05-04 | 9498  | 8929 |
| 2016-05-05 | 8350  | 5758 |
| 2016-05-06 | 3508  | 6342 |
| 2016-05-07 | 5097  | 6219 |
| 2016-05-08 | 5491  | null |
| 2016-05-09 | 3350  | null |
| 2016-05-10 | 9669  | null |
| 2016-05-11 | 8929  | null |
| 2016-05-12 | 5758  | null |
| 2016-05-13 | 6342  | null |
| 2016-05-14 | 6219  | null |

## LEAD(x,y,z)

• lead函数也可以接收三个参数,第三个参数用来传入默认值,应用场景是当使用lead函数返回null的时候,可以用第三个参数传入的默认值进行填充

• 练习44中,后7行出现了null,这里可以传入默认值,如-1,用来避免出现null的情况

```
SELECT

day,
users,
LEAD(users, 7, -1) OVER(ORDER BY day) AS `lead`

FROM statistics

WHERE website_id = 2

AND day BETWEEN '2016-05-01' AND '2016-05-14';
```

| day        | users | lead |
|------------|-------|------|
| 2016-05-01 | 7058  | 5491 |
| 2016-05-02 | 7716  | 3350 |
| 2016-05-03 | 6877  | 9669 |
| 2016-05-04 | 9498  | 8929 |
| 2016-05-05 | 8350  | 5758 |
| 2016-05-06 | 3508  | 6342 |
| 2016-05-07 | 5097  | 6219 |
| 2016-05-08 | 5491  | -1   |
| 2016-05-09 | 3350  | -1   |
| 2016-05-10 | 9669  | -1   |
| 2016-05-11 | 8929  | -1   |
| 2016-05-12 | 5758  | -1   |
| 2016-05-13 | 6342  | -1   |
| 2016-05-14 | 6219  | -1   |

# 2 LAG(x)函数

- LAG(x)函数与LEAD(x)用法类似,区别是,LEAD返回当前行后面的值, LAG返回当前行之前的值
- 示例:

```
SELECT
name,
opened,
LAG(name) OVER(ORDER BY opened)
FROM website;
```

。 上面的SQL会返回当前日期的前一行开业日期

• 注意: LEAD(...) 和 LAG(...),之间可以互相替换,可以在ORDER BY的时候通过 DESC 来改变排序方式,使 LEAD(...) 和 LAG(...) 返回相同结果,比如:

```
LEAD (...) OVER(ORDER BY ...)
```

#### 与下面的写法相似

```
LAG (...) OVER (ORDER BY ... DESC)
```

#### 再看:

```
LEAD (...) OVER(ORDER BY ... DESC)
```

#### 与下面的写法相似

```
LAG (...) OVER (ORDER BY ...)
```

• 需求: 统计id为3的网站每天的点击数量, 前一天的点击数量

```
SELECT
  day,
  clicks,
  LAG(clicks) OVER(ORDER BY day) as `lag`
FROM statistics
WHERE website_id = 3;
```

| day        | clicks | lag  |
|------------|--------|------|
| 2016-05-01 | 1      | null |
| 2016-05-02 | 1      | 1    |
| 2016-05-03 | 1      | 1    |
| 2016-05-04 | 1      | 1    |
| 2016-05-05 | 2      | 1    |
| 2016-05-06 | 3      | 2    |
| 2016-05-07 | 2      | 3    |
| 2016-05-08 | 8      | 2    |
| 2016-05-09 | 2      | 8    |
| 2016-05-10 | 6      | 2    |
| 2016-05-11 | 8      | 6    |
| 2016-05-12 | 4      | 8    |
| 2016-05-13 | 4      | 4    |
| 2016-05-14 | 3      | 4    |
| 2016-05-15 | 9      | 3    |
| 2016-05-16 | 11     | 9    |
| 2016-05-17 | 4      | 11   |
| 2016-05-18 | 8      | 4    |
| 2016-05-19 | 11     | 8    |
| •••••      | •••••  |      |

# LAG(x,y)

• 与LEAD(x,y)类似,LAG(x,y)返回当前行的前y行结果

```
SELECT
  name,
  opened,
  LAG(opened,2) OVER(ORDER BY opened)
FROM website;
```

- 使用LAG y = 2 , 所以返回的是两行以前的数据
- LEAD 和 LAG 容易记混
  - 。 LEAD 领先的意思 找行号更大的数据
  - · LAG 落后的意思 找行号更小的数据

• 需求: 统计id = 3的网站每日广告收入以及三天前的广告收入

```
SELECT
  day,
  revenue,
  LAG(revenue, 3) OVER(ORDER BY day) AS `lag`
FROM statistics
WHERE website_id = 3;
```

| day        | revenue | lag  |
|------------|---------|------|
| 2016-05-01 | 0.10    | null |
| 2016-05-02 | 0.21    | null |
| 2016-05-03 | 0.30    | null |
| 2016-05-04 | 0.15    | 0.10 |
| 2016-05-05 | 0.37    | 0.21 |
| 2016-05-06 | 0.70    | 0.30 |
| 2016-05-07 | 0.39    | 0.15 |
| 2016-05-08 | 1.59    | 0.37 |
| 2016-05-09 | 0.31    | 0.70 |
| 2016-05-10 | 1.81    | 0.39 |
| 2016-05-11 | 2.18    | 1.59 |
| 2016-05-12 | 0.94    | 0.31 |
| 2016-05-13 | 0.90    | 1.81 |
| 2016-05-14 | 0.60    | 2.18 |
| 2016-05-15 | 1.65    | 0.94 |
| 2016-05-16 | 2.41    | 0.90 |
| 2016-05-17 | 0.83    | 0.60 |
| 2016-05-18 | 1.81    | 1.65 |
| 2016-05-19 | 3.07    | 2.41 |
| •••••      | •••••   |      |

# LAG(x,y,z)

- 与LEAD(x,y,z)一样, LAG(x,y,z) 最后一个参数是默认值, 用来填补NULL值
- 修改前面的SQL,当LAG返回NULL时用-1填补

```
SELECT
  day,
  revenue,
  LAG(revenue, 3, -1.00) OVER(ORDER BY day)
FROM statistics
WHERE website_id = 3;
```

| day        | revenue | lag   |
|------------|---------|-------|
| 2016-05-01 | 0.10    | -1.00 |
| 2016-05-02 | 0.21    | -1.00 |
| 2016-05-03 | 0.30    | -1.00 |
| 2016-05-04 | 0.15    | 0.10  |
| 2016-05-05 | 0.37    | 0.21  |
| 2016-05-06 | 0.70    | 0.30  |
|            |         |       |

# 练习47

每干次展示收入RPM (revenue per thousand impressions) 定义: 收入
 (revenue) 除以展示次数 (impressions) 乘 1000.

```
RPM = (revenue / impressions) * 1000
```

For each statistics row with website\_id = 2, show the day, the RPM
and the RPM 7 days later. Rename the columns to RPM and RPM\_7.

• 需求: 统计id为2的网站,每天的RPM以及7日后的RPM

○ 返回字段: day, RPM 和 RPM\_7

```
SELECT
  day,
  revenue / impressions * 1000 AS RPM,
  LEAD(revenue, 7) OVER(ORDER BY day) / LEAD(impressions, 7)
OVER(ORDER BY day) * 1000 AS RPM_7
FROM statistics
WHERE website_id = 2;
```

| day       | RPM      | RPM_7    |
|-----------|----------|----------|
| 2016/5/1  | 1.090252 | 0.738481 |
| 2016/5/2  | 0.457058 | 0.571475 |
| 2016/5/3  | 0.629998 | 0.928327 |
| 2016/5/4  | 0.703305 | 0.83324  |
| 2016/5/5  | 0.923113 | 0.532592 |
| 2016/5/6  | 0.501354 | 0.764269 |

| 2016/5/29 | 0.45329  | NULL  |
| 2016/5/30 | 0.571439 | NULL  |
| 2016/5/31 | 1.199981 | NULL  |

- 转化率定义: 转化率=点击次数 clicks /展示次数 impressions \*100
- 需求: 统计id=1的网站,5月15日至5月31日,每天点击次数 clicks, 展示次数 impressions,转化率(conversion)和前一天的转化率(previous\_conversion)

```
SELECT
  day,
  clicks,
  impressions,
  clicks / impressions * 100 AS conversion,
  LAG(clicks) OVER(ORDER BY day) / LAG(impressions) OVER(ORDER
BY day) * 100 AS previous_conversion
FROM statistics
WHERE website_id = 1
  AND day BETWEEN '2016-05-15' AND '2016-05-31';
```

| day            | clicks | impressions | conversion             | previous_conversion    |

# 3 FIRST\_VALUE(x)函数

• FISRT VALUE函数,从名字中能看出,返回指定列的第一个值

```
SELECT
  name,
  opened,
  budget,
  FIRST_VALUE(budget) OVER(ORDER BY opened)
FROM website;
```

• 上面的SQL中,我们按 opened 列进行排序, FIRST\_VALUE(budget) 返回的是开业最早的网站的预算 budget

## 练习49

• 需求: 统计id为2的网站每天用户访问情况, 以及最少用户访问人数

```
SELECT
  day,
  users,
  FIRST_VALUE(users) OVER(ORDER BY users) as `first_value`
FROM statistics
WHERE website_id = 2;
```

| day        | users | first_value |
|------------|-------|-------------|
| 2016-05-09 | 3350  | 3350        |

| 2016-05-12 | 5758  | 3350        |
| 2016-05-15 | 5881  | 3350        |
| 2016-05-23 | 5971  | 3350        |
| 2016-05-14 | 6219  | 3350        |
| 2016-05-13 | 6342  | 3350        |
| 2016-05-28 | 6682  | 3350        |
| 2016-05-29 | 6701  | 3350        |
| 2016-05-03 | 6877  | 3350        |
| 2016-05-01 | 7058  | 3350        |

• 需求: 统计id=3的网站收入情况,返回日期,收入,和第一天的收入

```
SELECT
  day,
  revenue,
  FIRST_VALUE(revenue) OVER(ORDER BY day) AS `first_value`
FROM statistics
WHERE website_id = 3;
```

| day        | revenue | first_value |
|------------|---------|-------------|
| 2016-05-01 | 0.10    | 0.10        |
| 2016-05-02 | 0.21    | 0.10        |
| 2016-05-03 | 0.30    | 0.10        |
| 2016-05-04 | 0.15    | 0.10        |
| 2016-05-05 | 0.37    | 0.10        |
| 2016-05-06 | 0.70    | 0.10        |
| 2016-05-07 | 0.39    | 0.10        |
| 2016-05-08 | 1.59    | 0.10        |
| 2016-05-09 | 0.31    | 0.10        |
| 2016-05-10 | 1.81    | 0.10        |
| 2016-05-11 | 2.18    | 0.10        |
| 2016-05-12 | 0.94    | 0.10        |
| 2016-05-13 | 0.90    | 0.10        |
| 2016-05-14 | 0.60    | 0.10        |
| 2016-05-15 | 1.65    | 0.10        |
| 2016-05-16 | 2.41    | 0.10        |
| 2016-05-17 | 0.83    | 0.10        |
| 2016-05-18 | 1.81    | 0.10        |
| 2016-05-19 | 3.07    | 0.10        |
|            |         |             |

# 4 LAST\_VALUE(x)函数

• FIRST\_VALUE(x)返回第一个值,LAST\_VALUE(x)返回最后一个值

```
SELECT
  name,
  opened,
  LAST_VALUE(opened) OVER(ORDER BY opened)
FROM website;
```

• LAST\_VALUE(opened) 返回最近开始营业的网站,我们运行一下

| name             | opened     | last_value |
|------------------|------------|------------|
| Gaming Heaven    | 2016-02-01 | 2016-02-01 |
| All About Health | 2016-03-15 | 2016-03-15 |
| Around The World | 2016-05-01 | 2016-05-01 |

• 查询结果与我们预期的有些出入,它只返回了当前行的结果,而不是我们想要的最后一个值

## LAST\_VALUE 与 window frame

- 在上面的例子中,我们没有得到想要的结果,回顾一下之前我们所介绍的 window frame
  - 。 当 OVER 子句中包含 ORDER BY 时,如果我们不显式定义window frame, SQL会自动带上默认的window frame语句:

RANGE UNBOUNDED PRECEDING, 意味着我们的查询范围被限定在第一行到当前行(current row)

- 如果想通过LAST\_VALUE 与ORDER BY配合得到所有数据排序后的最后一个值,需要吧window frame语句写成
  - RANGE BETWEEN UNBOUNDED PRECEDING AND UNBOUNDED FOLLOWING 或者
  - ROWS BETWEEN UNBOUNDED PRECEDING AND UNBOUNDED
     FOLLOWING
- 修改上面的SQL

```
SELECT
  name,
  opened,
  LAST_VALUE(opened) OVER(
    ORDER BY opened
    RANGE BETWEEN UNBOUNDED PRECEDING
    AND UNBOUNDED FOLLOWING) AS `last_value`
FROM website;
```

| name             | opened     | last_value |
|------------------|------------|------------|
| Gaming Heaven    | 2016-02-01 | 2016-05-01 |
| All About Health | 2016-03-15 | 2016-05-01 |
| Around The World | 2016-05-01 | 2016-05-01 |

- 从上面的结果中可以看出,调整了window frame之后我们可以得到 LAST\_VALUE 想要的结果
- FIRST\_VALUE 使用默认的window frame就可以正常工作,但是 LAST\_VALUE 想要得到预期的结果需要手动修改window frame
- 与 FISRT\_VALUE 类似,我们在使用 LAST\_VALUE 时,传入的字段与排序的字段可以有区别

## 练习51

• 需求: 统计id为1的网站的广告展示情况,返回每日日期,广告展示次数,以及访问用户最多的一天广告展示的次数

```
SELECT
  day,
  impressions,
  LAST_VALUE(impressions) OVER(
    ORDER BY users
    ROWS BETWEEN UNBOUNDED PRECEDING
    AND UNBOUNDED FOLLOWING) AS `last_value`
FROM statistics
WHERE website_id = 1;
```

| day        | impressions | last_value |  |
|------------|-------------|------------|--|
| 2016-05-15 | 59941       | 519701     |  |
| 2016-05-20 | 86640       | 519701     |  |
| 2016-05-05 | 163455      | 519701     |  |
| 2016-05-21 | 152944      | 519701     |  |
| 2016-05-27 | 191828      | 519701     |  |

| 2016-05-06 | 369030      | 519701     |  |
| 2016-05-13 | 198328      | 519701     |  |
| 2016-05-17 | 175861      | 519701     |  |
| 2016-05-08 | 296252      | 519701     |  |
| 2016-05-14 | 165702      | 519701     |  |
|            |             |            |  |

• 需求: 统计id为1的网站,每日的访问用户数,最后一天的访问用户数,每日用户数与最后一天用户数的差值

```
SELECT
  day,
  users,
  LAST_VALUE(users) OVER(
    ORDER BY day
  ROWS BETWEEN UNBOUNDED PRECEDING
    AND UNBOUNDED FOLLOWING) `last_day_users`,
  users - LAST_VALUE(users) OVER(
    ORDER BY day
    ROWS BETWEEN UNBOUNDED PRECEDING
    AND UNBOUNDED FOLLOWING) `diff`
FROM statistics
WHERE website_id = 1;
```

| day        | users | last_day_users | diff   |
|------------|-------|----------------|--------|
| 2016-05-01 | 36169 | 34817          | 1352   |
| 2016-05-02 | 29580 | 34817          | -5237  |
| 2016-05-03 | 30907 | 34817          | -3910  |
| 2016-05-04 | 19154 | 34817          | -15663 |
| 2016-05-05 | 10897 | 34817          | -23920 |
| 2016-05-06 | 24602 | 34817          | -10215 |
| 2016-05-07 | 19882 | 34817          | -14935 |

| 2016-05-19 | 33504 | 34817          | -1313  |
|            | ••••• | •••••          | ••••   |

# 5 NTH\_VALUE(x,n)函数

- 本小节最后一部分要介绍的就是 NTH\_VALUE(x,n) 函数
- NTH\_VALUE(x,n) 函数返回x列,按指定顺序的第n个值

```
SELECT

name,
opened,
NTH_VALUE(opened, 2) OVER(
ORDER BY opened
ROWS BETWEEN UNBOUNDED PRECEDING
AND UNBOUNDED FOLLOWING)
FROM website;
```

- 上面的SQL将数据按照开业日期排序, NTH\_VALUE(opened, 2) 返回开业日期排在第二位的值
- 需要注意,我们需要调整window frame 否则某些情况下不能返回正确的数据
- 提示:可以在排序的时候加上 DESC 调整排序的顺序,配合 NTH\_VALUE(x,n) 在某些场景下更加方便

• 需求: 统计id为2的网站的收入情况,在5月15和5月31日之间,每天的收入,以及这半个月内的第三高的日收入金额

```
SELECT
  day,
  revenue,
  NTH_VALUE(revenue,3) OVER (
    ORDER BY revenue DESC
  ROWS BETWEEN UNBOUNDED PRECEDING
    AND UNBOUNDED FOLLOWING) `3rd_highest`
FROM statistics
WHERE website_id = 2
  AND day BETWEEN '2016-05-15' AND '2016-05-31';
```

| day        | revenue | 3rd_highest |
|------------|---------|-------------|
| 2016-05-17 | 100.64  | 54.38       |
| 2016-05-30 | 60.08   | 54.38       |
| 2016-05-22 | 54.38   | 54.38       |
| 2016-05-31 | 53.26   | 54.38       |
| 2016-05-26 | 48.72   | 54.38       |
| 2016-05-28 | 47.52   | 54.38       |
| 2016-05-19 | 40.46   | 54.38       |
| 2016-05-29 | 36.45   | 54.38       |
| 2016-05-15 | 36.42   | 54.38       |
| 2016-05-23 | 30.93   | 54.38       |
| 2016-05-21 | 28.50   | 54.38       |
| 2016-05-24 | 20.82   | 54.38       |
| 2016-05-18 | 20.79   | 54.38       |
| 2016-05-25 | 20.32   | 54.38       |
| 2016-05-16 | 18.50   | 54.38       |
| 2016-05-27 | 10.51   | 54.38       |
| 2016-05-20 | 9.77    | 54.38       |

# 6 X\_VALUE函数练习

## 练习54

- 需求,统计5月14日的不同网站收入情况,返回如下字段:
  - 网站id website\_id ,当日收入 revenue
  - 。 所有网站当日最高收入 highest\_revenue
  - 所有网站当日最少收入 lowest\_revenue

```
SELECT
  website_id,
  revenue,
  FIRST_VALUE(revenue) OVER(ORDER BY revenue) AS
lowest_revenue,
  LAST_VALUE(revenue) OVER(
    ORDER BY revenue
    ROWS BETWEEN UNBOUNDED PRECEDING
    AND UNBOUNDED FOLLOWING) AS highest_revenue
FROM statistics
WHERE day = '2016-05-14';
```

| website_id | revenue | lowest_revenue | highest_revenue |
|------------|---------|----------------|-----------------|
| 3          | 0.60    | 0.60           | 85.50           |
| 2          | 38.71   | 0.60           | 85.50           |
| 1          | 85.50   | 0.60           | 85.50           |

## 练习55

- 需求: 统计id为1的网站的点击量,返回如下字段
  - 日期 day ,点击量 clicks , 5月点击量的中位数
  - 提示: 5月一共31天,将点击量按顺序排列,第16位点击量即为中位数

```
SELECT
  day,
  clicks,
  NTH_VALUE(clicks, 16) OVER(
    ORDER BY clicks DESC
    ROWS BETWEEN UNBOUNDED PRECEDING
    AND UNBOUNDED FOLLOWING) AS `median`
FROM statistics
WHERE website_id = 1;
```

| day        | clicks | median |
|------------|--------|--------|
| 2016-05-03 | 1545   | 526    |
| 2016-05-30 | 1382   | 526    |
| 2016-05-10 | 1029   | 526    |
| 2016-05-22 | 992    | 526    |
| 2016-05-19 | 857    | 526    |
| 2016-05-06 | 804    | 526    |
| 2016-05-31 | 796    | 526    |
| 2016-05-02 | 793    | 526    |
| 2016-05-08 | 782    | 526    |
| 2016-05-23 | 773    | 526    |
| 2016-05-28 | 645    | 526    |
| 2016-05-16 | 609    | 526    |
| 2016-05-18 | 594    | 526    |
| 2016-05-27 | 564    | 526    |
| 2016-05-24 | 553    | 526    |
| 2016-05-13 | 526    | 526    |
| 2016-05-29 | 446    | 526    |
| 2016-05-11 | 423    | 526    |
| 2016-05-25 | 416    | 526    |
| •••••      |        | •••••  |

- 需求: 统计id为3的网站每天点击的情况,返回如下字段
  - 。日期 day ,点击量 clicks ,最高点击量和当天点击量的比例 ratio (用整数表示)

```
SELECT
  day,
  clicks,
  ROUND(clicks / LAST_VALUE(clicks) OVER(
    ORDER BY clicks
    ROWS BETWEEN UNBOUNDED PRECEDING
    AND UNBOUNDED FOLLOWING) * 100) as `ratio`
FROM statistics
WHERE website_id = 3;
```

| day        | clicks | round |
|------------|--------|-------|
| 2016-05-01 | 1      | 1     |
| 2016-05-02 | 1      | 1     |
| 2016-05-03 | 1      | 1     |
| 2016-05-04 | 1      | 1     |
| 2016-05-09 | 2      | 1     |
| 2016-05-05 | 2      | 1     |
| 2016-05-07 | 2      | 1     |
| 2016-05-06 | 3      | 2     |
| 2016-05-14 | 3      | 2     |
| 2016-05-12 | 4      | 2     |
| 2016-05-17 | 4      | 2     |
| 2016-05-13 | 4      | 2     |
| 2016-05-10 | 6      | 4     |
| 2016-05-21 | 7      | 4     |
| 2016-05-11 | 8      | 5     |
| 2016-05-08 | 8      | 5     |
| 2016-05-18 | 8      | 5     |
| 2016-05-15 | 9      | 5     |
| 2016-05-20 | 9      | 5     |
| 2016-05-16 | 11     | 7     |

# 小结

- LEAD(x) 和 LAG(x) 分别返回传入的列x对于当前行的下一行/前一行的值
- LEAD(x,y) 和 LAG(x,y) 分别返回传入的列x对于当前行的后y行/前y 行的值

- FIRST\_VALUE(x) 和 LAST\_VALUE(x) 分别返回列x 的第一个值/最后
   一个值
- NTH\_VALUE(x,n) 返回 x列的 第n个值
- LAST\_VALUE 和 NTH\_VALUE 通常要求把window frame修改成 ROWS
  BETWEEN UNBOUNDED PRECEDING AND UNBOUNDED FOLLOWING

- 业务背景:网站老板决定尝试新的商业模式:网站上只有一个广告位,对该广告位拍卖。支付最高价的人将在一天之内在网站上展示他们的广告
- 该表非常简单: 日期 (天) 支付的价格 (价格)

| price | day        |
|-------|------------|
| 33.03 | 2016-06-01 |
| 43.84 | 2016-06-02 |
| 37.25 | 2016-06-03 |
| 50.16 | 2016-06-04 |
| 26.63 | 2016-06-05 |
| 47.36 | 2016-06-06 |
| 32.02 | 2016-06-07 |
| 28.16 | 2016-06-08 |
